

SRS

LazyStarter

v0.1

Problem:

Web developers often have a common starting point for new projects. Most developers use self-made github repositories as starting points. More often than not you end up either creating 100 scaffold-templates or change 90% of the code-base of whatever template you start out with.

Solution:

A highly customizable CLI tool for scaffolding projects of any kind. Code generation is highly parameterized. Templates will be built in use-time by composing compatible components using flags.

Usage Example:

```
$ lazystarter landing-page  
$ done.  
  
$ lazystarter landing-page --dark --background-video --sidebar --bigfoot  
$ done building a landing page with dark mode, background video, a sidebar and a big footer.
```

Deliverables:

1. Installer or pip package
2. Command line tool
3. Developer Wiki
4. End-User Wiki
